NTRP-style 3.5-4.0

Confidence 95%

Your one-handed backhand shows a solid foundation with an excellent unit turn and good balance. However, the main area for improvement is your contact point. You are currently meeting the ball too late and too close to your body with a bent arm, which limits your power, depth, and consistency. Our focus will be on creating more space and extending your arm to strike the ball well out in front, transforming this shot into a reliable weapon.

Fix of the Day

Extend your arm to meet the ball further out in front.

Potential impact: +7 to +9 level points, projected score 77 if this fix shows up in the next clip.

COACH NOTES

✓ What you did well

● Excellent Unit Turn

Your preparation is top-notch. By turning your shoulders and back to the net, you create the necessary coil to generate effortless power and disguise your shot direction.

● Stable Balance

You maintain excellent balance throughout the entire motion. This provides a solid foundation, which is critical for both consistency and power, and makes it easier to execute shots under pressure.

⚠ What to improve

● Late Contact Point

Your primary focus should be on meeting the ball earlier. Striking the ball next to your hip instead of in front of your body forces a bent-arm swing, robbing you of power and control.

● Bent Arm at Impact

Aim to have your arm nearly straight at the moment of contact. This maximizes your leverage and reach, allowing you to use your body's rotation to generate racket head speed effectively.

MECHANICS DETAILS

Preparation

▲ +20

85

Elite Target: 90 | Trend ▲ +20 | Confidence High | Estimated impact +2 to +3 pts

You have an excellent unit turn, getting your shoulders turned sideways to the net early. This coil is crucial for generating rotational power. Maintain this quality of preparation on every backhand.

WHY THIS MATTERS

Earlier preparation gives you more time, reduces rushed contact, and makes the swing easier to repeat.

Timing

▼ -10

50

Intermediate Target: 70 | Trend ▼ -10 | Confidence High | Estimated impact +5 to +7 pts

Your timing is slightly late, causing you to make contact adjacent to your body rather than in front. This is the root cause of the bent-arm swing and power loss. Adjusting your timing to meet the ball earlier will unlock better mechanics.

WHY THIS MATTERS

Better timing keeps the strike zone predictable, which improves depth, pace, and control under pressure.

Contact Point

▼ -15

45

Intermediate Target: 70 | Trend ▼ -15 | Confidence High | Estimated impact +7 to +9 pts

Your contact point is too close to your body and behind your front foot. A bent arm at impact saps power and reduces the hitting zone. We need to move the contact point forward and away from you to allow for full arm extension.

WHY THIS MATTERS

Forward contact usually adds power and depth while giving you more time to recover for the next ball.

Kinetic Chain

▼ -5

60

Intermediate Target: 70 | Trend ▼ -5 | Confidence High | Estimated impact +2 to +4 pts

While you load well with your legs and torso rotation, the energy transfer is interrupted by the late, jammed contact. By extending your arm and timing the hit correctly, you'll link the chain from the ground up through the ball.

WHY THIS MATTERS

A cleaner leg-to-hip-to-arm sequence creates easier power and reduces the need to muscle the ball.

Balance

▲ +5

80

Elite Target: 90 | Trend ▲ +5 | Confidence High | Estimated impact +2 to +4 pts

Your balance is a clear strength. You maintain a stable base from the unit turn through the follow-through, even with the timing issue. This solid foundation will make it much easier to adjust your contact point.

WHY THIS MATTERS

Better balance keeps the racket face steadier and helps you recover without drifting after the shot.

Follow-through

▼ -5

65

Intermediate Target: 70 | Trend ▼ -5 | Confidence High | Estimated impact +2 to +3 pts

The follow-through is a bit short and restricted because the swing starts from a cramped position. A proper contact point will naturally lead to a longer, more fluid follow-through, extending towards the target before finishing high.

WHY THIS MATTERS

A complete follow-through lets the racket accelerate through contact and finish the shot naturally.

Racket Path / Face

▲ +10

70

Advanced Target: 80 | Trend ▲ +10 | Confidence High | Estimated impact +2 to +4 pts

You have a good low-to-high swing path, which is great for generating topspin. However, the late contact can cause the racket face to be unstable, leading to inconsistent control. A more extended contact point will stabilize the racket face through impact.

WHY THIS MATTERS

A cleaner racket path and face angle make height, spin, and direction easier to control.

PREPARATION

0:10.76

Excellent Preparation

Notice how your shoulders are fully turned and your chin is over your front shoulder. This is a textbook unit turn that coils your upper body, preparing it to uncoil powerfully into the ball. This is a major strength in your stroke.

Cue: Great Shoulder Turn | Swing direction: Racket setup | Coach target: Shoulder turn | Checkpoint: Set earlier

CONTACT

0:25.44

Jammed Contact Point

0:25.44

➤ Extend Arm at Contact

/ Ideal Extension

Here is the key area to fix. Your arm is bent and you are striking the ball beside your body. Look at the space between your arm and torso. We want to extend the arm fully, moving the contact point further out in front to create leverage and power.

Cue: Extend Arm at Contact | Swing direction: Extend Through Ball | Coach target: Ideal Extension | Checkpoint: Current Contact

RECOVERY

0:41.10

Ready for Next Ball

Your recovery is efficient. You've finished your swing and are already turning back to face the court, ready for the next shot. This habit of quick recovery is essential for staying in points during competitive play.

Cue: Efficient Recovery | Swing direction: Finish path | Coach target: Recovery step |
Checkpoint: Move back

SWING PHASES

90

Ready

▲ +20

OBSERVED

You have an athletic stance with good posture and weight on the balls of your feet.

FIX

This is a solid ready position. The key is to return to it consistently after every shot.

95

Unit Turn

▲ +25

OBSERVED

Your shoulders are turned past 90 degrees, with the racket head up and prepared early.

FIX

This is a model preparation phase. Trust this setup on every backhand you hit.

70

Racket Drop

▲ +10

OBSERVED

The racket drops below the ball, but your upper body begins to open towards the net a bit prematurely.

FIX

Try to feel your front shoulder staying closed a fraction longer as the racket drops and starts to move forward.

45

Contact

▼ -15

OBSERVED

The contact point is visibly adjacent to your front hip, and your hitting arm is significantly bent.

FIX

Focus on the feeling of reaching out to meet the ball. A good checkpoint is to see the contact happen in line with your front foot.

60

Follow-through

▼ -10

OBSERVED

The swing finishes, but lacks full extension out towards the target before wrapping around your body.

FIX

Exaggerate reaching your racket head towards your target after impact. This will encourage a better contact point and a more complete swing.

85

Recovery

▲ +20

OBSERVED

You are pushing off your back foot and turning your hips back towards the center of the court.

FIX

Your recovery movement is good. Make your first recovery step as explosive as possible to be ready for the next ball.

THIS WEEK

1

1. Define Your Focus

For the next two weeks, your single focus on the one-handed backhand is creating space and extending your arm to make contact well in front of your body.

2

2. Technical Drill: Fence Extension

Perform 3 sets of 15 shadow swings daily using the Fence Drill. Stand far enough from a fence that you can only complete a full swing by extending your arm completely. This builds the muscle memory for the correct spacing.

3

3. On-Court Practice: Slow Ball Feeds

Spend 15 minutes of your next practice session having a partner feed you slow, deep balls to your backhand. Ignore power and focus exclusively on the sensation of meeting the ball early and in front of your lead foot. Gradually increase the pace as you get comfortable.

4

4. Retest and Verify

After one week of focused practice, film your backhand again during a rally. Compare the new contact frame to this analysis. Your goal is to see a visibly straighter arm and a contact point that is clearly ahead of your body.

Backhand Extension Fence Drill

Stand sideways, a full arm and racket's length from a fence. Perform slow, controlled backhand swings. Your goal is to fully extend your arm through the 'contact zone' without the racket touching the fence. This drill forces you to create space and extend, preventing a jammed, bent-arm swing.
